SUMMARY

Almost two years in product and delivery (requirements, process design, competitor benchmarking), now building AI-assisted products end to end on my own, from problem and requirements to prompts, build and testing.

EXPERIENCE

Chengdu VisionVS Technology Co., Ltd., Product Assistant & Delivery Engineer, Chengdu, China *Jul 2023 – Mar 2025*

- Owned an internal project-management system end to end: compared how 4 systems organise work, derived requirements for departments that could not state them, designed one flow per project type, and delivered it.
- Ran competitor benchmarking for an EHS product: reviewed 5 vendors (about 196 core functions), compared 3 systems function by function, turned the findings into design decisions and adapted them to one customer's processes.
- Wrote requirements and technical documentation with clients for interactive electronic technical manuals (IETM, IETP) and an EHS system; trained users and worked with developers.

PROJECTS

Build experience summary: agree the MVP and record what is done and not done; study existing apps and repositories, then personalise; keep short documents that let me restart after months away; work in phases; keep prompts short with AGENTS.md; test as I build, then one full smoke test; trim scope; close with a snapshot, a git commit and a record of deletions.

Short Story Expander | Personal AI writing tool, AI-assisted build | Next.js, TypeScript, SQLite

- **Goal:** cut the time to turn planned plot beats into prose without losing my own taste; one story took about 6 hours.
- **My decisions:** the plot stays mine; five sets of writing rules refined by repeated write, read and adjust cycles; a local workbench (SQLite, Markdown with block markers) that builds one task file per block; AI runs through Codex in VS Code instead of a paid API, as I had no API budget; features not built yet are kept as reserved Markdown files and interfaces, tracked in a STATUS document.
- **Result:** about 6 hours down to about 2 per story, plus small edits (my own estimate). A story written this way reached 65,231 impressions and 35,565 reads on Fanqie (author dashboard, to 13 Oct).

JobPilot | Personal job-search web app, AI-assisted build | Next.js, TypeScript, Supabase

- **Goal:** keep every saved job, its status and each interview's lessons in one place.
- **My decisions:** one feature per problem: six dated statuses, interview rounds with a four-prompt reflection template, a board and a timeline, a profile with files. Hosted backend on Supabase because a job search stores a lot of content: login, PostgreSQL with row-level security so only I can read the data, private file storage.
- **Result:** a working app where each problem has a direct feature; code on GitHub.

Check-up Planner | AI-assisted tool | JavaScript, bilingual, runs in the browser

- **Goal:** guideline-based check-up advice that adapts to the person, with evidence level and source for each item.
- **My decisions:** I selected the 41 rules and fixed their sources, and designed adjustments for lifestyle, personal and family history where guidelines are silent. No backend by design: it runs in the browser, so nothing a user enters is sent or stored. Tested repeatedly.
- **Result:** five evidence levels; 9 tests guidelines advise against for people without symptoms are listed separately.

Personal website | AI-assisted build | HTML, CSS, JavaScript, GitHub Pages

- **My decisions:** static site on GitHub Pages with no backend, updated by uploading files; I set the requirements and content and refined the layout and wording over many rounds.

AI short films | contest entries | TapNow

- **My role:** designed the plot, character and environment images and storyboard, and refined the prompts, for two films that TapNow generated: unihorse (1 min 5 s, HappyHorse video-model contest) and 门外的牵挂 (2 min 29 s, concept film for a smart-lock brand, not a client project).

SKILLS

Product: requirements analysis, competitor benchmarking, process design, technical documentation, user training, working with developers

AI: prompt and skill design, human-AI workflow design, AI-assisted development, checking AI output against known values

Build and data: Next.js, TypeScript, Supabase (PostgreSQL), SQLite, Python, R, SQL, Streamlit, Git/GitHub

Languages: English (IELTS 6.5 overall), Mandarin (native)

EDUCATION

University College Dublin (UCD), MSc Statistical Data Science (GPA 3.54/4.0) *Sep 2025 – Present*

Harbin University of Commerce, BSc Statistics *Sep 2019 – Jun 2023*
